

The given process represents that the method of producing sugar from sugar cane.

As can be seen, this process has seven steps, which start with growing seeds and ultimately finish with drying and cooling sugar.

The first step, the seed of sugar canes grow between 12-18 months, and then there are two ways for harvesting this plant, such as both handy and mechanical harvesting. The third level is crushing, the sugar canes are put in a crusher machine and juice of sugar is released finally. After that the juice of sugar should be purified with a limestone filter. In the fifth step, the juice ought to be converted to syrup by heater machine, this level name is evaporating. Next, all sugar crystals should be separated from syrup by an important centrifuge device. And the last step sugar will be dried and cooled in a huge box.
