

The given map provides an outlook from the current design of an airport and a plan by which it illustrates its future appearance after a year.

It is conspicuous that many new facilities are supposed to be added to the airport, along with relocating some of the other parts. Notably, the size of the airport will become a little larger than its current size.

To begin with, the small rectangular site of the entrance to the airport with eight gates will be converted to a by far much bigger Y shape area with almost more than doubled gates. The map belongs to the current form of the airport demonstrates a walkway trough which travelers can either enter or exit from the building, while after the redevelopment of it, a new sky train will serve them for transporting.

Moreover, in the arrival hall, a new ATM, a café, and a car hire center will be opened to the right side of it, while in the departure hall, a bag drop area will be constructed in the top left corner. Some new shops, also, will be established in a smaller hall, between the security and passport controlling area, and gates area. In addition, one more entry will be opened at both the departure and the arrival sections to make more space for passengers when they are passing them.

In terms of relocated facilities, a café in the top right corner of the departure hall will be transferred to the opposite location in the bottom left corner, and the check-in section will be moved to the right side of the hall to make way for the new mentioned bag drop area.
